

Barangay Integrated System

Gawad BIS (Barangay Information System) + **BHC** (Barangay Health Center System)
Barangay Balong Bato, San Juan City

Unified GitHub repository for barangay resident records, health center patient registry, multi-station queues, and clinical workflow — with integration between both applications.

PDF for reviewers: [README.pdf](#) — printable overview of this repository (setup, structure, integration).

Local path: `C:\PUP\barangay-integrated-system-repo`

Repository structure

```
barangay-integrated-system-repo/

│       └── Project.Gawad.Client/
```

Folder	Stack	Purpose
bhc-system	PHP, MySQL	Patient registry, queues, triage, consultation, pharmacy, doctor portal
gawad-bis	.NET 8, MongoDB	Residents, permits, medicine inventory, BHC integration APIs

Documentation

Document	Description
README.pdf	Start here (PDF) — repository overview for reviewers and thesis panel
bhc-system/docs/README.md	Full documentation index (Markdown guides)
bhc-system/docs/USER_GUIDE.md	BHC operations (queues, clinical workflow, doctor portal)

Document	Description
bhc-system/docs/INTEGRATED_USER_GUIDE.md	Gawad ↔ BHC integration (SSO, resident handoff, medicine sync)
bhc-system/docs/SOURCE_CODE_AND_DOCUMENTATION.md	Architecture, APIs, setup (technical)

Prerequisites

Tool	Used by
XAMPP (Apache + MySQL + PHP 8.1+)	BHC
.NET 8 SDK	Gawad BIS
MongoDB	Gawad BIS
Git	This repository

First-time setup

1. Clone the repository

```
git clone https://github.com/YOUR_USERNAME/barangay-integrated-system.git
cd barangay-integrated-system-repo
```

2. BHC (Health Center)

Option A — use existing XAMPP copy (if you develop in htdocs):

Keep working in `c:\PUP\htdocs\bhc_system` and treat `bhc-system/` here as the Git source of truth. Sync changes before commit.

Option B — run from this repo:

1. Copy or junction `bhc-system` into XAMPP `htdocs` as `bhc_system`, **or** configure Apache to serve `bhc-system/public`.
2. Create MySQL database `brgy_health_db` (optional: import `bhc-system/database_schema.sql`).
3. Edit `bhc-system/config/database.php` if needed (default XAMPP: `root` / empty password).
4. Copy integration config:

```
cd C:\PUP\barangay-integrated-system-repo
copy bhc-system\config\gawad_integration.local.example.php bhc-system\config\gawad_integration.local.php
```

5. Open: `http://localhost/bhc_system/public/login`

Default admin (first install): **admin** / **admin123** — change before production.

3. Gawad BIS

1. Ensure **MongoDB** service is running.
2. From this repo root:

```
cd C:\PUP\barangay-integrated-system-repo
.\start-gawad.ps1
```

Or manually:

```
cd gawad-bis\src\Project.Gawad.Client
dotnet run --launch-profile http
```

3. Open: <http://localhost:5003>

4. Enable integration (both sides)

Gawad — `gawad-bis/src/Project.Gawad.Client/appsettings.json`:

```
"BhcIntegration": {
  "Enabled": true,
  "BaseUrl": "http://localhost/bhc_system/public",
  "OpenInNewTab": true,
  "ResidentSyncEnabled": true,
  "MedicineSyncEnabled": true,
  "IntegrationApiKey": "your-integration-key",
  "SsoEnabled": true,
  "SsoSecret": "your-sso-secret",
  "SsoTokenLifetimeSeconds": 300
}
```

BHC — `bhc-system/config/gawad_integration.local.php`:

```
return [
    'enabled' => true,
    'api_base_url' => 'http://localhost:5003',
    'integration_api_key' => 'your-integration-key',
    'sso_enabled' => true,
    'sso_secret' => 'your-sso-secret',
    'medicine_sync_enabled' => true,
];
```

Use the **same** integration key and SSO secret on both sides. Local overrides are listed in `.gitignore` and must not be committed.

5. Verify integration

1. Sign in to Gawad BIS.
2. Open a resident profile → **Register at Health Center**.
3. BHC should open (SSO) with the patient form prefilled.

Running locally (daily)

Step	Action
1	Start XAMPP (Apache + MySQL)
2	<code>cd C:\PUP\barangay-integrated-system-repo</code> → <code>.\start-gawad.ps1</code> (keep window open)
3	Gawad: http://localhost:5003
4	BHC: http://localhost/bhc_system/public

Push to GitHub

From this folder:

```
cd C:\PUP\barangay-integrated-system-repo
git init
git add .
git status
git commit -m "Initial commit: BHC + Gawad BIS integrated system"
git remote add origin https://github.com/YOUR_USERNAME/barangay-integrated-system.git
git branch -M main
git push -u origin main
```

Before the first commit, confirm `git status` does **not** list `gawad_integration.local.php` or Gawad `bin//obj/` folders (see `.gitignore`).

Integration features

Feature	Description
Health Center menu	Gawad sidebar links to BHC queues and patients
SSO	Sign in to BHC automatically from Gawad
Register at Health Center	Prefill BHC patient form from Gawad resident
Staff import	BHC admin imports Gawad users for matching logins

Feature	Description
Medicine sync	BHC prescription picker reads Gawad inventory (read-only)

Details: [bhc-system/docs/INTEGRATED_USER_GUIDE.md](#)

What not to commit

See [.gitignore](#). In particular:

- [bhc-system/config/gawad_integration.local.php](#) (API keys)
- [bhc-system/config/database.infinityfree.php](#) (production DB password)
- Gawad `bin/`, `obj/`, `.vs/`
- Build and deploy output folders

Commit **example** config files only ([gawad_integration.local.example.php](#), base [appsettings.json](#) with dev placeholders).

Databases — what goes on GitHub?

You do **not** upload the live databases themselves. MySQL and MongoDB store data on your PC/server, not inside the Git repo.

Upload to GitHub?	Item	Why
Yes	bhc-system/database_schema.sql	Empty table structure + default stations — reviewers need this to set up BHC
Yes	bhc-system/config/database.php	Connection settings (host, db name) — no patient data
Yes	Gawad appsettings.json	MongoDB URL template (mongodb://127.0.0.1:27017) — no resident records
Yes	bhc-system/scripts/seed_*.php	Optional dev scripts to generate sample data locally
No	MySQL data dump (mysqldump with patients, queues, users)	Privacy + size; contains real or test PHI
No	MongoDB dump (mongodump , .bson files)	Same — residents, medicines, user accounts
No	XAMPP mysql/data/ folder	Raw database files on disk
No	MongoDB data/ directory	Raw database files on disk

BHC (MySQL — [brgy_health_db](#))

1. Clone the repo.
2. Create database: `brgy_health_db`
3. Import schema only:

```
mysql -u root brgy_health_db < bhc-system\database_schema.sql
```

4. Start the app — `config/database.php` also runs `ensureSchema()` for any missing columns.
5. First login: **admin** / **admin123** (auto-created if no users exist).

Optional sample data (local dev only):

```
cd bhc-system
php scripts/seed_dummy_patients.php
php scripts/seed_clinical_data.php
```

Gawad BIS (MongoDB — `gawad_db`)

1. Start MongoDB.
2. Run Gawad — it creates collections on first use.
3. `SeedDataHostedService` seeds initial roles/admin on first run (see Gawad deploy docs in `gawad-bis/`).

Each developer or reviewer creates their **own** local database from schema + seeds — they do not download your data from GitHub.

For thesis / demo submission

- Document setup steps (already in this README and `bhc-system/docs/`).
- Optionally include **anonymized** sample export in a separate zip **outside** GitHub if required — never commit real barangay resident or patient names from production.

License / academic use

Developed for Barangay Balong Bato, San Juan City. Refer to your course or barangay authority for distribution terms.
